AMENDMENT(S) TO THE CLAIMS:

The following listing of claims will replace all prior versions, and listings, of claims on the application. All claims are set forth below with one of the following annotations.

- (Original): Claim filed with the application.
- (Currently amended): Claim being amended in the current amendment paper.
- (Canceled): Claim cancelled or deleted from the application. No claim text is shown.
- (Withdrawn): Claim still in the application, but in a non-elected status.
- (New): Claim being added in the current amendment paper.
- (Previously presented): Claim added or amended in an earlier amendment paper.
- (Not entered): Claim presented in a previous amendment, but not entered or whose entry status unknown. No claim text is shown.

1.-2. (Cancelled).

- 3. (Previously presented) In a multi viewer environment where multiple viewers simultaneously experience an audio-visual production with the visual production occurring on a display surface, a method of increasing the perceived reality of the audio stream of the production, the method comprising the steps of:
 - (a) locating a plurality of at least three speakers along a periphery of the viewing audience; and
 - (b) panning an audio stream between the series of speakers so as to provide for the sense of an audio sound moving in a front to rear or rear to front direction along the periphery of the viewing audience,

wherein step (b) further comprises the step of panning the same audio stream to a set of at least three speakers along the periphery whilst simultaneously delaying the audio stream transmitted to each speaker by an amount that varies along with the panning gain.

4.-5. (Cancelled).

6. (Previously presented) In a multi viewer environment where multiple viewers simultaneously experience an audio-visual production with the visual production occurring on a display surface, a method of increasing the perceived reality of the audio stream of the production, the method comprising the steps of:

S/N 09/933,470 Page 3 LAKE030

- (a) panning an audio stream between at least three speakers so as to provide for the sense of an audio sound moving in a front to rear or rear to front direction along the periphery of the viewing audience, and
- (b) whilst panning the audio stream, delaying the output of one of the speakers relative to another speaker.
- 7. (Original) A method according to claim 6 wherein the relative delay between the outputs from at least two of the speakers varies along with the panning gain.
- 8. (Original) A method according to claim 6 wherein said audio stream includes a channel containing spatial information, including one of panning gain and delay, for a component of said audio stream to be panned.

9.-10. (Cancelled).

11. (Previously presented) A system for increasing the perceived reality of an audio stream in a multi viewer environment where multiple viewers simultaneously experience an audio-visual production, with the visual production occurring on a display surface, the system comprising:

a series of at least three speakers located along a periphery of the viewing audience; and

panning means for panning a sound trajectory between the speakers so as to simulate the effect of a sound trajectory along the periphery of the audience,

wherein said panning means further comprises delay means for delaying the output of at least one speaker relative to another.

12. (Original) A system according to claim 11 wherein said delay means varies the delay of said speaker output by an amount that varies with the panning gain.

13.-16. (Cancelled).
